E3P Edited book
Environment protection and pig production

This book explores the outstanding issues in agricultural development and its environmental externalities in one province of Northern Vietnam. Its coverage of agricultural issues ranges from the details of on-farm management practices issues to the balances of nutrients at regional level and the perception of the society to suggest alternative strategies.

The book brings together the background issues and findings to guide researchers and policymakers in their domestic policies on agriculture and livestock considering environmental protection. The book also explores the key questions for global agricultural policies, both the impacts of current development policies and the regional implication on environment.

The **CD-Rom** contains detailed supplementary tables, maps, appendixes and background reading recommended by the authors.
